

## Driver, Software and Firmware Updates

### Driver Updates

On a regular basis, be it monthly or quarterly, your IT personnel should check your computer manufacturer's Website for urgent and recommended patches specific to your computer model. Driver updates can fix stability issues with a system.

### Software Updates

Your software should be checked for updates on a regular basis as well. Software updates can improve performance, fix stability issues, fix security vulnerabilities, or add new features.

### Firmware Updates

Firmware updates for your hard drives could prevent them from breaking prematurely. Firmware updates for devices like your firewall can improve security and sometimes add new features. Tape backup drives should also be updated with the latest firmware if available.
